The EDI88128C is a high speed, high performance, Monolithic CMOS Static RAM organized as 128Kx8.

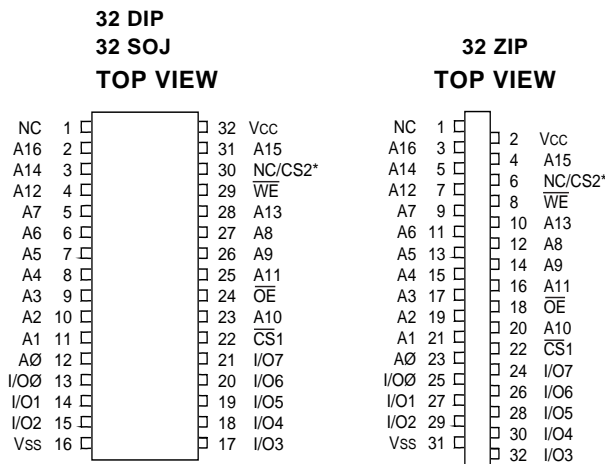

The device is also available as EDI88130C with an additional chip select line (CS₂) which will automatically power down the device when proper logic levels are applied.

The second chip select line (CS₂) can be used to provide system memory security during power down in non-battery backed up systems and simplify decoding schemes in memory banking where large multiple pages of memory are required.

The EDI88128C and the EDI88130C have eight bi-directional input-output lines to provide simultaneous access to all bits in a word. An automatic power down feature permits the on-chip circuitry to enter a very low standby mode and be brought back into operation at a speed equal to the address access time.

Low power versions, EDI88128LP and EDI88130LP, offer a 2V data retention function for battery back-up operation. Military product is available compliant to Appendix A of MIL-PRF-38535.
